other platforms Crucc for Windows, Crucc for Windows Mobile, Crucc for Windows CE, Crucc for OS X and Crucc for Linux are available in. The latest version is 2.2.5. What is Crucc? Crucc is a car audio code (anti-theft) serial calculation program. CRUCC is a small tool designed to calculate and decode car audio security codes or passwords using the serial numbers of the car audio components and the anti-theft settings (set by the audio system itself or a firmware upgrade) for particular car make and model. The password can be entered manually, using radio station frequencies, or using an online frequency database. Crucc. How does it work? Crucc is using a database of radio stations to get the frequency values. With

Crucc you can access millions of frequencies, and it searches the database for the correct frequency when you input the password and press Calculate. Let's say you have installed a car audio system in your car, you change the anti-theft settings from Dealer to Professional. Then when you get in the car you remember the password, but you don't remember the serial numbers of the radio components. You can use Crucc to calculate the anti-theft settings and find out what the serial numbers are. Then you can enter the serial numbers in a terminal program and find out what the password is. Crucc can be used to calculate auto-calibration security codes for: Transistor radios CD players Integrated amplifier radios
