In my application, I have a number of sessions (RESTful backends - RESTlets) which I embed in the main asp.net MVC web site. Each of these RESTlets can be used both as a standalone view and in the main web site. Some of the RESTlets have a UI implemented in JQuery so while they are embedded the main web site will call an AJAX call to the the RESTlet and the RESTlet will then handle the request. So I have a number of questions regarding sessions and the stack. I will preface this by saying that I have very little experience with sessions or the HTTP protocol. 1) My understanding is that when you attach to a session (e.g. from a RESTlet to an embed site) the current stack is increased so that we can make the request (or I am at least thinking this is what I know). For example, when a RESTlet is embedded into the main site, then it has to create a new HttpApplication so it can post the request and then it can attach to the main site HttpContext. Now my understanding is that this stack now has many more scopes that it had before. 2) This question is for when the RESTlet is detach from the main site. Does it leave behind the additional scopes? Does it then continue to use the original stack or is it created with the original
