Aging and its associated diseases and conditions, such as osteoporosis, have become a major medical concern, both in the U.S. and abroad. According to the World Health Organization, there are currently about 200 million people in Europe over the age of 50, and this number is expected to double within the next 30 years. Aging, osteoporosis, and trauma/fractures continue to affect a vast number of people. Osteoporosis is a progressive disease characterized by decreased bone density, weakened bones, and increased susceptibility to fractures. The disease has an important impact on public health and safety, the quality of life of aging people, the health care system, and the economy. Osteoporosis is also one of the most costly diseases to society, with direct and indirect costs estimated to be in the range of \$17 billion annually in the United States. Direct costs include the treatment of fracture-related injuries, nursing home care, and death. Indirect costs include lost productivity, reduced wages, and decreased participation in the workforce. While osteoporosis is the most common type of bone disease,
