Code. PDF. This invention relates generally to large-area planar-heterojunction photodiodes, and more specifically to method for reducing the surface current leakage in such devices. High-speed photodetectors are important for applications such as fiber-optic communications, because they are one of the dominant sources of noise in the system. Planar-heterojunction photodetectors, fabricated by stacking two-dimensional layers of semiconductor materials of different bandgaps, have been used as an alternative to conventional PIN photodiodes. Compared to PIN diodes, planar heterojunction devices are able to detect light of longer wavelengths because the lower bandgap

---

semiconductor can be used as a transparent window to enhance the absorption of the higher bandgap material. The spectral sensitivity of these devices can be varied by designing for a different barrier height between the two layers. An improvement to the basic planar-heterojunction device is the pin diode heterojunction device (PHD). A pin diode heterojunction device includes an intrinsic absorption layer that absorbs light, and one or more heterojunction regions between the intrinsic absorption layer and a transparent window. The transparent window and the intrinsic absorption layer form a potential barrier that restricts the flow of the surface current to the surface of the photodiode.

---

Pin diode heterojunction devices are described in, for example, U.S. Pat. No. 5,898,661, which is incorporated by reference in its entirety. The surface current leakage can be reduced in the above-referenced planar-heterojunction devices by the addition of dopants of the same conduction type to the intrinsic absorption layer. The dopants are designed to compensate for the negative charge on the surface of the intrinsic absorption layer and therefore reduce the surface current flow. For example, an N-type dopant, e.g. P, is used to compensate the negative charge on the surface of the intrinsic

Spitz I was in a coffee shop and saw a  
very odd looking guy with an unruly  
beard and unusual haircut. I thought to  
myself, "This guy's a mad genius." My  
idea of what a mad genius looks like was  
a mostly bald person in a cape and a beard  
who was running about and screaming.  
This wasn't that guy. But, I still found him  
interesting, as I often do. Another day at  
the coffee shop and the mad genius had  
grown into a monstrous, grunting, big  
bearded guy. I'm convinced that this guy  
was not very pleasant company. I am  
unsure what he wanted from the people in

---

the shop, but I can't imagine it was anything nice. Nonetheless, the people didn't seem to mind being in his presence as he seemed to growl out his requests, as if they were of utmost importance. I looked at this person who, I imagined, was some sort of a genius with a capital G and he wore this look that somehow said, "I am both powerful and a little confused." It reminded me of how some monks dress. The monks in my village wore unusual, mostly hand-me-down clothes and always seemed to have mischievous smiles on their faces. They claimed that they lived in the wilderness, and so they looked the part. I sat there for awhile watching this man. He seemed to avoid eye contact, as well as everyone

---

else. I thought, “Maybe he’s just shy.” Eventually, I had to ask him, “Are you mad?” He didn’t reply. I was curious, so I said, “I noticed that you were grunting. Would you like some coffee?” He didn’t say anything, just grunted again. Now I had a theory. He was getting his jollies out of not being understood. I was intrigued, so I replied, “I’m sorry. Is that what you want? Coffee?” This made him grunt louder than before, “That’s
